

## Key Order for Thermoteknix

Thermoteknix have just won a key order for the 3 of its new VisIR® Human Temperature Monitoring Systems. The equipment has been purchased by the Thai Ministry of Health in Bangkok as part of the ongoing defence against the SARS virus which recently resurfaced in the region. It is based on Thermoteknix' patented VisIR® camera technology and has been developed as a fully portable system to be used in airports and other key sites to help monitor and screen large numbers of people for abnormally high body temperature. The systems have already been installed and are being used to screen visitors to the beautiful Thai island of Phuket. The other two systems are in operation at Hat Yai and Chiang Mai airports.

Software automatically screens for a given temperature which can be set to trigger an audible or visible alarm or can alternatively command the system to take both a thermal and corresponding visual image of the subject. Various options are available with the VisIR® system including direct data output to a desktop

display or wireless transmission to a handheld device such as a PDA or notebook. There is also a fixed installation version of the system (MIRICLE®) which utilises a smaller, miniature infrared camera model.
